

Additive manufacturing (AM)

Short Learning Programme (SLP)

Additive manufacturing (AM) is one of the technologies set to revolutionise how engineered products are manufactured. This technology has already had an impact in the field of Health Sciences, and this is evidenced by the migration to additively manufactured prostheses and dentures (amongst others). The SLP seeks to create awareness amongst professionals and students in the healthcare sector about the latest developments in AM, particularly on how the technology is influencing the field on a broader level. This will be further reinforced by having a practical session wherein participants are to 3D print models using an FDM printer.

Cost: R4000.00

Course Convenor: Dr Nkosinathi Madushele
